## Shop-Windows, Panels Behind Glass

**With the Through Glass solution you can make a window or glass surface touch sensitive, so the user can operate, e.g. through a shop-window like on a normal touchscreen - but with the benefit that the electronic is not in reach of the user**

The system we supply is a capacitive version where foil is stuck to the inside of the glass and a touch field will be projected through it.

### Benefits:

- No perforation of the glass panel needed
- No expensive or sensitive parts are reachable for the users
- Touches are registered very precisely, even if the user, e.g. wears a glove or taps very softly
- Scratches on the glass or window surface do not affect the touch sensitivity
- You can use existing displays or projector

**Therefore you are available for your customers even after closing time, around-the-clock.**

### Possible application:

- Shop-window
- Showcase
